SUMMER SALES ANALYSIS

Copyright © 2026. All rights reserved.

INTRODUCTION

In this report analysis results are presented of Wish summer sales 2020 data analysis. The report is structured to the main sales overview, followed by a look into the effect of ratings and badges. Finally, a closer look is taken at product selections corresponding to product tags “dress” and “shirt”.

About Wish

Wish is an online and mobile shopping app that provides a platform for different sellers to connect with customers¹. They offer clothes and various other items such as daily accessories and electronics. In this way it is similar to marketplaces such as Temu and Aliexpress. Wish was founded in 2010 and is known for very affordable pricing. Wish has been critiqued for their goods to be cheaply made the company has been focusing on improving the quality and reducing order refund rates². Below is a view of the current (as of March 2025) trending products web page of Wish.

DATA SET

Data set consists of sales data of products from summer 2020 which are tagged as “summer”. All the product tags were comma-separated and were extracted to enable the use of tags in the Power BI analysis. The resulting many-to-many table structure with a linking table ProductTag is shown in appendix A. The following columns and measures added to the original data set are presented below.

Column	Description
discount	retail_price minus price
discount_pct	discount/retail_price
DiscountBin	Category for the discount e.g. “20-40%”
MerchantRatingRounded	Merchant rating rounded to the nearest 0.5
revenue	units_sold times price
revenue (bins)	Revenue grouping in bins of 30 000€

Measure	Description
Avg_Revenue_per_merchant	Average product revenue per merchant
DistinctMerchantCount	Distinct count of merchants

SALES OVERVIEW

The data contains information on 1341 products. Confirming the low-price focus of Wish, the average price of a product is 8.46€. Total units sold in the summer data set is 6.5 million leading to total revenue of 52.4 million €. From the figure below we can see that the first revenue bin contains the most products and that corresponds to revenue range from 0 to 30 000€.

Count of products by revenue (bins of 30k €)

Certain few products generate revenue many times more than this, up to 800 000€ and these are listed in the table below.

Title of the item	revenue
New Aeeival Women Clothing Long Sleeve Autumn Winter Ball Gown Dress Slim Fit Patchwork Casual Lace Dress Vestido De Renda	800,000.00
Women Lace Beach Boho Maxi Sundress Sleeveless Long Dress Party Holiday Strapless Dresses	750,000.00
Women Lace Short Sleeve Long Tops Blouse Shirt Ladies Beach BOHO Mini Dress 6-16	700,000.00
Women Stretchy Camisole Spaghetti Strap Long Tank Top Slip Mini Dress 4Color SIZE XXL is available Now	577,000.00
Women's Summer Sexy Sleeveless Turtleneck Mini Dress	567,000.00
Women's Striped Double Up Tankini Top	550,000.00
2018 New Fashion Women's Tops Sexy Strappy Sleeveless Lace Crop Tops	500,000.00
Womens Summer Red White and Blue Chiffon Short-Sleeve T-Shirt	500,000.00
Hot Latest Sexy Bikini Women Fashion Swimming Suit Beach Bikini with Bracket Gather NOR	450,000.00
Sexy Women Casual Striped T-shirt Long Tops Blouse Kaftan Beach Shirt Mini Dress	450,000.00
New Fashion Women Solid Color Casual Dially Demin Romper Overalls Jumpsuit Demin Pants Demin Blue Large Size S-3XL	440,000.00
Comfy Sleeveless Hooded Mini Dress	400,000.00
Summer Women Sexy White Embroidery Lace Crop Top Plus Size Clubwear Flare Sleeve Clothing	400,000.00
Summer Steering Wheel Sunshade Swim Ring Car Inflatable Baby Float Seat Boat Pool Tools Accessories For Kids Toys	380,000.00
Pandolah Hot Women One Piece Bathing Suit Dotted Beachwear Push up Swimsuit Plus Size Swimwear Monokini M-3XL	360,000.00

As the tag “summer” was used to filter the data set, it is not surprising that clothes bring the most revenue. From the list we can see that women’s dresses and tops make the most of the top selling products with items such as beach wear and a kids’ pool toy also included.

WOMEN’S FASHION FORMS THE BULK OF SUMMER SALES

We can further examine what makes up the top revenue products by looking at which tags and colors are most represented. This is illustrated below.

This further confirms that women’s fashion products dominate summer sales products that generate the most revenue. The most revenue by color is generated by black and white products. This is also expected, but color data should still be regarded with some caution. A dress for example could have multicolor patterns with black or white being the most dominating one and thus black or white would be assigned as the product color.

QUALITY MERCHANTS BRING REVENUE

The dashed line of the figure below shows that there is an increasing trend of more unit sales as user review rating increases. The units sold appear to peak at around rating 4. Key influencer analysis also indicates that when the rating is in the range of 3.52 to 4.48 it has an increasing effect on the revenue of 31 400€.

One question is why the highest ratings don't generate more unit sales. A likely explanation is that once a product becomes very popular, the products of Wish are such that the ratings do not stay in the very high range but start to converge downwards. It can also be purely by coincidence that certain products get a high rating in the beginning but won't be popular in average and do not generate sales.

Key influence analysis also shows the positive effect of merchants being rated above 3.79, increasing revenue by 35 850€. Further look at the merchant rating is shown below. The charts show that while the most common merchant rating is 4.0, when rounded to the nearest half, the merchants rated at 4.5 generate more revenue per product. This emphasizes the importance of including high quality merchants in the Wish marketplace.

BADGES AND DISCOUNTS

On the whole, when looking at the average product revenue, the effect of badges seems to be limited as can be seen from the column charts below. The average product revenue is approximately the same regardless of whether a badge is toggled or not. Product quality badge is an exception with product quality badge being associated with 65 % more revenue than without the badge.

The effect of discounts in increasing product revenue is not linear. The chart on the right shows that discounts of 20 to 40% and 80 to 100% have the highest revenue when discounts are positive. This means that customers might not respond yet when the discount is increased from 40%, only after the discount percentage is very high. Possibly only the highest discount percentages catch the attention of the customer. Negative discounts arise in a situation in which the product sales price is higher than the retail price. Related revenue can be interpreted by the fact that for the more popular products, the price can be increased over the retail price without hurting demand.

SHIRTS

Taking a closer look at different product categories using tag information, we can see some differences when looking at tag “shirt”. The local product badge has significantly more impact on revenue. The total product units of 20 000 sold using that badge was relatively minor, but this would still merit further investigation into why these products sold well.

The effect of discounts on revenue is broadly similar for shirts as for all products. The main difference is that using discounts at 40-60% is even more associated with smaller revenue. The faint blue bars show the all-product averages.

DRESSES

For the tag “dress” we see a stronger revenue boost of 97% for products having the quality badge. Of the units sold, 9% were sold with that tag.

The effect of increasing the discount percentage is more linear for dresses and we are seeing a clearer increase in revenue as the discount percentage increases. One explanation can be that since on average dresses are more expensive than shirts, the customers respond better to increasing the discounts. Overall, the average prices show the low-price strategy of Wish.

Average of revenue by Discount %

CONCLUSION

Revenue from summer tagged products of Wish come overwhelmingly from clothes, especially items such as women's dresses, tops and shirts. Receiving at least user ratings in the range of 4 is related to increasing revenue. In addition, analysis shows that increase in merchant rating is related to higher sales and emphasizes the importance of having highly rated merchants in the Wish marketplace. Often the use of badges is not observed leading to higher revenue. There are exceptions, such as dresses with quality badge selling more.

Discounts can behave differently depending on product categories. Overall it seems that adding discounts from 40% does not necessarily lead to increasing revenue, except for the highest discounts of 100%. Dresses respond more to discounts than products overall.

Product averages can give insights, but the analysis results point to the importance of looking into specific product categories when making conclusions about said products, instead of relying on averages. A limitation of the analysis is that only revenue could be derived from the data. As cost of goods sold was not included in the data set, only differences in revenue could be analyzed. A further analysis should also take costs into account to make conclusions about how profits are generated.

Considering the results of the analysis, the following actions are recommended:

- Working with merchants to ensure they get better ratings as this increases revenue. Withdrawing poorly performing merchants from the marketplace.
- Targeted experimentation with badges. Assigning more quality badges to selected dresses and observing if revenue premium from the badge persists. Further analysis of different badges in distinct product categories.
- Incorporating the cost of goods sold data to analyze profits more accurately.
- Experimenting with discounts so that discounts from 0 to 40% and 80 to 100% are emphasized and the amount of 40 to 80% discounts are reduced.

APPENDIX A - DATA MODEL
